1. Executive summary

BrightPath can get the buyer’s procurement teams working quickly with a straightforward cloud analytics application. The product brings purchasing data into a common dashboard and can be configured for the requested departments. We prioritize a low initial cost and a short path to launch.

2. Solution and schedule

Our hosted platform includes dashboards, supplier records, and exportable reports. Standard file imports are available; integration details for the buyer’s ERP will be confirmed during onboarding. The application supports user accounts and configurable permissions. Architecture and scaling specifics can be shared in a technical workshop.

We target a 12-week launch: kickoff and data review (2 weeks), configuration (4 weeks), imports and user testing (4 weeks), and training and launch (2 weeks). The team includes one implementation manager and two configuration specialists. The schedule assumes timely sample files and one buyer contact. We have not included a detailed contingency schedule.

3. Price and service
Year 1 price: $420,000, comprising $120,000 onboarding and $300,000 annual subscription for 1,200 users. Additional data imports may incur fees after discovery. Travel, taxes, and custom reports are excluded. Renewal pricing is subject to the order form.

The service is hosted in a major cloud environment. Data is encrypted in transit and at rest. We support standard login controls and can discuss single sign-on options. Detailed certification status, audit-log retention, data residency, and incident response commitments are not specified in this response.

Support is available by email during business hours, with urgent issues escalated to an on-call engineer. BrightPath has completed several small-business reporting deployments; this would be our first procurement analytics deployment at this user scale. Customer references can be arranged after mutual approval.
